

# Lesson 1

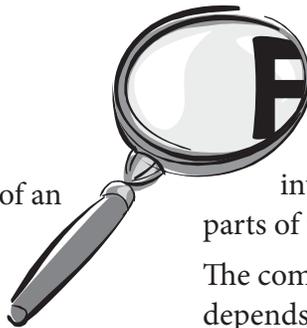

## The Web of Life

### Objectives:

1. Understand the concept of an ecosystem.
2. Understand the interdependence of members of an ecosystem.

### Subjects:

1. Ecology
2. Language
3. Art

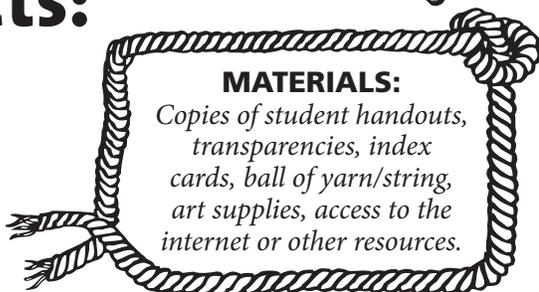

### Focus:

1. A forest ecosystem involves the complex interaction of all of the living and non-living parts of the ecosystem.

The community of organisms living in the forest depends upon each other and interacts with each other in a number of ways.

Give examples of types of communities that students are familiar with:

- Classroom
- Town
- Neighborhood
- Family

#### MATERIALS:

Copies of student handouts, transparencies, index cards, ball of yarn/string, art supplies, access to the internet or other resources.

2. Establish the concept of an ecological community by identifying the Greek word “oikos” (house) and “logos” (the study of) as the basis of the word “ecology”. **Basically, ecology is the study of how plants and animals interact with each other and the environment where they live.**

Ask the class to think of some examples of ecological communities. Write them on the board. Below are some suggestions:

- Forest
- Field
- Stream
- Ocean
- Lake
- Backyard
- Pond
- Fallen Log
- Fish Tank

Ask students to name some of the members of these ecological communities. For Example:

- **Forest** = trees, shrubs, grass, wildlife, insects, fish, people, fungi, bacteria, lichen
- **Field** = mice, birds, insects, worms, deer, grass
- **Ocean** = fish, seaweed, mollusks (clams, snails), algae, bacteria
- **Backyard** = people, pets, grass, trees, shrubs, bacteria, insects
- **Fallen Log** = termites, fungi, bacteria, sow bugs, centipedes, mice, moss

## VOCABULARY

1. **Web of Life:** the network of relationships that interconnects all members of an ecological community.
2. **Ecology:** the study of how plants and animals interact with each other and their environment.
3. **Food Chain:** pathway along which food is transferred from one feeding level of organisms to another.
4. **Food Web:** the interconnected food chains of an ecosystem.
5. **Producer:** organisms that use energy from sunlight to make their own food through photosynthesis (i.e. trees).
6. **Consumer:** organisms that cannot make their own food, and must consume other organisms to get energy.
7. **Herbivore:** animal that eats plants (i.e. deer, rabbit).
8. **Carnivore:** animal that eats other animals (i.e. hawk, bobcat, shark).
9. **Omnivore:** animal that eats both plants and other animals (i.e. bear).
10. **Decomposer:** organism that absorbs nutrients from non-living material such as dead plants and animals and wastes of living organisms then recycles these nutrients so they can be used again by plants (i.e. bacteria, fungi).

CONTINUED ON REVERSE SIDE

The forest ecosystem distributes energy to all members of the community. Energy entering the ecosystem as sunlight is transferred by producers into chemical energy made during photosynthesis. This energy is then transferred from one organism to the next through the food web.

Plants, the **producers** of the ecosystem, use sunlight to make energy through photosynthesis.

**Herbivores** are animals that eat plants and **carnivores** are animals that eat the herbivores.

**Omnivores** eat both plants and other animals.

**Decomposers** break down waste materials and recycle it to a form that can be used again by the plants. This forms a **food chain**. If we take all of the food chains in an ecosystem and examine their relationships to each other, we have a **food web**.

(See **Forest Food Web** diagram, p. 6)

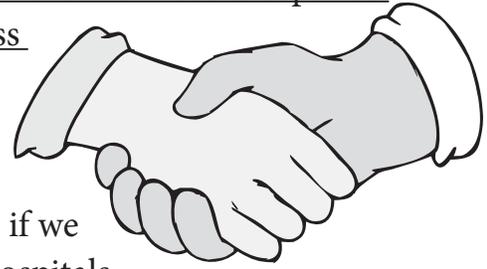

**3.** Teach the concept of *interdependence* and *feedback* mechanisms within the community by asking students to brainstorm characteristics that all ecological communities share in common. Examples are given below. As a class, come up with other examples for both your neighborhood and nearby forests.

- They all need energy (food) to survive. A plant needs energy from the sun, water, nutrients from the soil, carbon dioxide, and space to grow. Plants also depend upon animals for pollination and seed dispersal. Animals depend on plants for food and shelter. Where do we get our food? Where do we get our clothing and shelter? (Have students trace these back to the actual source—not the store!)

- The success of the community depends on the success of the individuals. What would happen to your school if the teachers or students did not attend? (This is an example of interdependence)

- The success of the individuals depends on the success of the community.

What would happen to us if we didn't have hospitals, water service, schools, law enforcement, grocery stores, etc.? (This is an example of interdependence)

- Organisms react to changes within their community. If your local park became very busy on Saturday afternoons, you might choose to go early in the morning instead. If a deer ate all of the grass in an area where it was feeding, it would move to a new area and probably return to the previous area once the food source replenished itself. (This is an example of a feedback mechanism)
- The community changes in response to changes by individual organisms within that community. If more people moved into your town, you might see new houses being built in your neighborhood. (This is an example of a feedback mechanism)

# Activity:

When something happens to one portion of an ecological community, everything connected to it is affected too. Demonstrate this concept by involving the whole class in one big food web.

1. Assign each student to play the role of one member of a forest community. Producers, herbivores, carnivores and decomposers should all be represented. Don't forget to include a human—humans also live, recreate, hunt, manage and use resources from the forest.
2. Give each student an index card with their organism's name on one side. Instruct them to research and write the following information on the other side of the card:

- Where specifically do they live in the forest (under a log, in burrows, do they use different parts of the forest)?
- What do they eat?
- What organisms might eat them?
- How does it interact with other animals/plants in its community?

3. After your students have finished their cards, take them outside and have everyone form a large circle. Have students tape their cards to their shirts so everyone can see the different organisms that are being represented.

## Making the Food Web:

1. Give the end of the ball of string to one of your producers (plants).
2. Have the producer hold onto the end of the string and pass the ball to the organism that eats it, then that organism passes it onto another organism that preys upon it.
3. Pass the ball onto a decomposer which recycles waste material nutrients back to the plants.
4. Students should be sharing the information about their organism when the string is passed to them. Continue the process until everyone is interconnected.
5. Have everyone pull gently on the food web to represent the interactions that are taking place in the food web. Ask what would happen if one organism were removed from the food web? Name the other organisms that are affected. What happens if two organisms are removed, etc.?

6. Share the following quote by John Muir with the students and ask them to interpret it based on what they just saw in the web of life activity.

*“When we try to pick out anything by itself, we find it hitched to everything else in the universe.”*

## Reinforcement:

Reinforce the food web activity back in the classroom by having students complete the **Forest Food Web** handout (page 6).
